

COMPLEX IMMUNO-GENE MEDICAL COMPOSITION FOR INHIBITING TUMOR CELLS

ABSTRACT OF THE DISCLOSURE

Disclosed is a complex immuno-gene medical composition for activating NK cells to enhance a host immune system. The composition includes a plurality of cytokines, including Th1 and Th2 cytokines. Th2 cytokines antagonize TGF- β inhibiting NK cells to disable the inhibition of the immune system. Th1 cytokines activate NK cells in a host to enhance the host's ability to fight against tumor cells. By use of the complex immuno-gene medical composition, removal of tumor cells is expected.
